

 Installation instructions
 Instrucciones de Instalación

Before You Start / Preparations

Please read all the instructions before you begin the installation.

Improper installation will void warranty.

Important notes:

After installing, make sure to keep the room within a temperature range of 50°F - 80°F. Excessive high or low temperatures may cause this product to expand or contract and lead to visual defects of the floor.

Installation is not recommended on exterior direct sunlight.

In cases where the flooring is in direct sunlight for much of the day (Sunrooms, etc.), it is recommended that plastic or glass shades be installed to prevent the floor from getting too hot.

During installation instructions, an improved premium Luxury Vinyl Plank (LVP) is used. Please refer to the manufacturer's instructions for adhesive manufacturer's instructions, including correct travel rates.

For the best result, make sure to always work from 2 to 3 corners at a time moving the planks during the installation.

• Calculate the room surface prior to installation and plan an extra 10% of flooring for cutting waste.

• If the boxes of flooring were exposed over 2 hours to extreme temperatures (under 50° or over 100°) within the 12 hours before the installation, the planks must be acclimated to the room's current room temperature for at least 12 hours before proceeding with the installation. The room temperature must be maintained consistently between 60° to 80° during the installation.

• For floor surfaces exceeding 4000 ft² and/or lengths exceeding 80 ft, use expansion readings.

• Inspect your subfloor before you begin. It must be clean and level to 3/16" within a 10 ft span.

• Although this floor is waterproof, it is not suited to be used as a moisture barrier. This floor must be dry (max 2.5% moisture content - CM method). This product is also not to be installed in areas that have a risk of flooding such as basements or outdoor areas.

• If you choose to install this floor over existing wood floors, it is recommended to repair any loose boards or sounds before you begin the installation.

• With a taping tool you must always ensure you leave a 1/4" gap between the floor and the wall, as well as plies and other stairs, etc. These gaps will allow for movement and expansion.

• When installing around pipes, drill the holes 3/4" larger than the diameter of the pipe.

• Decide the installation direction. It is recommended to install the length direction of the planks parallel to the main light fixture.

• Measure the area to be installed. The board width of the first row must not be less than 2'. If so, adjust the width of the first row to be installed to 2' and start the installation. It is recommended to install the floor parallel to the length of the room.

• Inspect each individual plank one by one before installing. No claims on surface defects will be accepted after installation.

• Due to the speed of sudden temperature changes, which has the potential to damage the floor, it is recommended to not exceed 81°F. Before installing over new, constructed radiant heat systems, consult the system at maximum capacity to force any residual moisture from the concrete slab. Once the system has been operating for 24 hours, moisture content of the screed is 1.5% (CM method). Shut down the heat system for 24 hours. Once the moisture content of the screed reaches the temperature in the room at least 60°F during installation, it is recommended that the radiant heat be applied in a gradual manner after installing. For more information, please refer to the manufacturer recommendations for additional guidance.

Tools and supplies required

- Spacers • Rubber Mallet • Ruler • Pencil
- Tape Measure • Utility Knife

① After thoroughly cleaning the subfloor, you should begin laying the floor in the interior corners. (See the following steps for how to lay the floor in interior corners between the wall and the hardboard)

② Lay the first row, leaving a 1/4" gap between the first row and the last row. Use a utility knife to cut the planks to size on the end of each row to fit on the previous row. (No spacers needed)

③ At the end of the first row, lay the first row and measure the length of the last plank to be cut.

④ If the last row is longer than 12', cut the last row to be the same length as the first row.

⑤ Lay the second row with the previous cut of the last row of the previous row. This will allow the floor to be laid in a staggered pattern. (See the following steps for how to lay the floor in interior corners between the wall and the hardboard)

⑥ Continue to lay the floor in a staggered pattern until the entire room is covered.

⑦ Once the floor is laid, trim the edges of the floor to fit the walls.
